MINI PROJECT DOCUMENTATION

CyberSaathi

Digital Safety Chatbot

Your Smart Companion for Safer Internet Use

Project Type	Educational cybersecurity awareness chatbot website
Development Platform	Base44 AI app builder
Live Project	nifty-cyber-saathi-guard.base44.app
Student Name	[Enter student name]
Department	Electronics and Communication Engineering (ECE)
College	[Enter college name]
Academic Year	2026–2027

A lightweight digital-awareness project designed to help users recognize common online scam warning signs and learn safer responses.

Prepared for academic project presentation and GitHub documentation.

Table of Contents

Documentation note: This document describes the project concept and intended functionality based on the supplied project title and URL. Features and test outcomes should be confirmed against the live website before the final academic submission.

1. Abstract

CyberSaathi — Digital Safety Chatbot is an educational website concept intended to help students and first-time internet users understand common online threats. These threats include phishing messages, suspicious links, fake job offers, OTP requests, impersonation, and unsafe payment requests. The proposed chatbot provides beginner-friendly explanations, warning signs, and practical next steps. It can use a curated knowledge base and rule-based responses for common questions, allowing a useful first version without requiring an external AI API. The website is created using Base44, an AI app-building platform that can generate application interfaces and workflows from natural-language instructions. The project is intended for awareness and learning; it does not guarantee that a message, link, or offer is safe.

2. Introduction

Digital services have made communication, education, job searching, shopping, and payments more convenient. At the same time, users may encounter fraudulent messages and misleading offers. New internet users may not know how to check a sender, recognize pressure tactics, protect one-time passwords (OTPs), or respond after clicking a suspicious link.

CyberSaathi aims to make basic cybersecurity guidance accessible through a simple chatbot website. Users can ask common questions or explore sample scenarios and receive explanations in plain language. The project emphasizes awareness, verification, and safe decision-making rather than technical malware detection.

3. Problem Statement

Students and first-time internet users may find it difficult to recognize phishing messages, suspicious URLs, fake work-from-home job offers, OTP or payment scams, and impersonation attempts. They may also be uncertain about what immediate steps to take when a message appears suspicious.

Problem statement: How can a lightweight, beginner-friendly chatbot website help users identify common online scam warning signs and learn safe next steps without requiring complex infrastructure or expensive external integrations?

4. Objectives

• Improve awareness of common online threats among students and beginner internet users.

• Explain warning signs in phishing messages, fake jobs, suspicious links, and requests for sensitive information.

• Provide clear, actionable safety guidance in simple language.

• Support learning through fictional examples and interactive quizzes, where implemented.

• Develop a responsive website using an AI-assisted, low-code/no-code platform.

• Encourage users to verify important claims using official channels and avoid sharing confidential credentials.

5. Scope and Users

Target users include college students, first-time internet users, and people seeking introductory digital-safety information. The initial scope focuses on education and guidance for common scam patterns. It is not intended to replace banks, law enforcement, professional incident-response teams, or dedicated security-scanning products.

The first version can be limited to text-based conversations and curated examples to reduce implementation complexity. Telugu/English multilingual support, more scenarios, and optional AI-generated explanations may be considered as future enhancements.

6. Proposed System and Features

• **Chat interface:** Allows a user to type a question and receive a topic-matched response.

• **Phishing awareness:** Explains suspicious messages, urgency, unexpected attachments, and requests to sign in through unfamiliar links.

• **Fake-job awareness:** Describes upfront-fee requests, unrealistic promises, and the importance of verifying employers independently.

• **OTP and payment safety:** Reminds users not to disclose OTPs, PINs, or passwords and to contact their bank through official channels if concerned.

• **Scenario-based learning:** Uses fictional scam examples to explain warning signs.

• **Quiz:** May provide short knowledge-check questions and feedback if included in the deployed version.

• **Emergency guidance:** Provides steps for suspected fraud and links to official reporting resources, if implemented.

7. System Architecture

The proposed lightweight architecture separates the user interface from the safety knowledge and response logic. A simple rule-based implementation can run without a third-party AI service.

Workflow: User → CyberSaathi website → Chat input → Topic matching / decision rules → Curated safety knowledge base → Guidance response → User.

The user enters a question or selects a suggested topic. The application identifies a matching category using predefined keywords or rules. It then displays an explanation, common warning signs, and safe next steps. If no match is found, the chatbot should say that it does not have a verified answer and direct the user to an official source.

This is a conceptual architecture. Confirm the actual internal implementation from the Base44 project before describing it as the exact deployed architecture.

8. Technology Stack

• **Base44:** AI-assisted platform used to create and publish the web application. Base44 supports natural-language app generation and refinement, with platform capabilities varying by plan and configuration.

• **User interface:** Responsive web pages and chat components generated/configured in Base44.

• **Response logic:** Proposed predefined knowledge base and topic-matching rules for common safety questions.

• **Content:** Curated introductory safety guidance and fictional examples.

• **Testing:** Manual checks of question matching, fallback responses, navigation, and mobile usability.

No specific external database, paid AI API, live URL scanner, or third-party integration is assumed in this document. Add these only if they are actually configured in the deployed project.

9. Implementation Methodology

• **Step 1 — Requirement definition:** Identify the intended users, common scam topics, and the chatbot's boundaries.

• **Step 2 — Prompt-based generation:** Describe the project and required pages to Base44 in natural language.

• **Step 3 — Interface creation:** Create the home page, chat area, safety-topic cards, and other selected sections.

• **Step 4 — Knowledge preparation:** Write clear, accurate answers for common topics and a safe fallback for unknown questions.

• **Step 5 — Functional refinement:** Check that buttons, topic selection, chat submission, and any quiz controls behave as intended.

• **Step 6 — Testing:** Try representative scam questions, unknown questions, and mobile layouts.

• **Step 7 — Publishing:** Publish the app through Base44 and record the public URL.

Base44 enables app creation through natural-language instructions and supports iterative refinement and publishing. The precise steps available depend on the user's account and project configuration.

10. Sample User Scenarios

Scenario A: Job offer requesting an upfront fee

User: "A recruiter asks me to pay a registration fee for a work-from-home job. What should I do?"

Expected guidance: Treat an upfront payment request as a warning sign. Verify the employer using independently found official contact details. Do not pay or share sensitive information until the offer is independently confirmed.

Scenario B: OTP request

User: "Someone claiming to be from my bank is asking for an OTP."

Expected guidance: Do not share the OTP, PIN, or password. End the interaction and contact the bank using its official app, website, or verified phone number.

Scenario C: Urgent account-blocking message

User: "A message says my account will be blocked unless I click a link."

Expected guidance: Avoid clicking the link. Open the official service independently and check for alerts there. Report the message using the service's official process.

These are sample test cases, not evidence that the deployed chatbot has already passed them.

11. Testing Plan

Testing should be performed after the website is available. Record the actual result for each case; do not mark tests as passed until they have been executed.

Test case	Input / action	Expected result	Actual result
TC-01	Ask about OTP sharing	Warn not to share OTP/PIN	To be tested

Test case	Input / action	Expected result	Actual result
TC-02	Ask about job registration fee	Explain upfront-fee warning sign	To be tested
TC-03	Ask an unsupported question	Safe, honest fallback response	To be tested
TC-04	Use navigation on mobile	Pages remain usable and links work	To be tested
TC-05	Restart quiz (if available)	Score resets and quiz restarts	To be tested

12. Security, Privacy and Limitations

• The chatbot provides educational guidance and cannot guarantee that a message, website, or job offer is legitimate.

• Do not ask users to enter real OTPs, UPI PINs, passwords, card details, or bank credentials.

• Avoid storing conversation content unless there is a clear need, suitable safeguards, and transparent user notice.

• A keyword-based chatbot may misunderstand ambiguous questions or fail to recognize new scam patterns.

• The initial version does not claim to scan URLs, inspect attachments, identify a scammer, or automatically report incidents.

• Users should independently verify important information and contact their bank or relevant official service when needed.

13. Expected Outcomes

• A publicly accessible, responsive website for basic digital-safety awareness.

• A structured collection of explanations for selected online scam categories.

• A simple way for beginners to explore safety questions and fictional scenarios.

• A demonstrable academic mini-project showing requirements analysis, interface design, response logic, and testing.

These are intended outcomes. Include measured results only after testing with real test cases and documenting the observations.

14. Future Enhancements

• Telugu and English language selection.

• Additional verified scenarios for social media, shopping, payment, and impersonation scams.

• A larger question-and-answer knowledge base and improved topic matching.

• Optional AI-powered explanations with safeguards and clearly communicated limitations.

• Links to official reporting and consumer-awareness resources.

• A structured test suite to evaluate response relevance, fallback behavior, and accessibility.

15. Conclusion

CyberSaathi — Digital Safety Chatbot proposes a simple and accessible way to teach introductory online safety. By explaining common warning signs and recommending safe next steps, it aims to help users make more informed decisions online. Base44 can simplify the creation and publication of the website, allowing the project to focus on usability and educational content. The project's value should be demonstrated through working features, careful testing, accurate information, and transparent limitations.

Appendix A. GitHub README Starter

Use the following text as a starting point for the README.md file in your GitHub repository. Update the feature list to match what is actually implemented.

```
# CyberSaathi — Digital Safety Chatbot

CyberSaathi is an educational chatbot website concept that helps students and first-time internet users learn about common online threats such as phishing messages, fake job offers, suspicious links, and OTP-related scams.

## Live Demo
https://nifty-cyber-saathi-guard.base44.app

## Built With
- Base44 AI app builder
- Responsive web interface
- Curated digital-safety content and rule-based responses (confirm against the deployed implementation)

## Goals
- Explain common scam warning signs
- Provide beginner-friendly safety guidance
- Encourage independent verification and safe online behavior

## Safety Notice
CyberSaathi provides educational information and cannot guarantee that any message, website, or offer is safe. Never enter real OTPs, passwords, UPI PINs, or banking credentials into a chatbot.

## Documentation
See `CyberSaathi_Mini_Project_Documentation.pdf` for the project report.
